How it works

ocean → depth → pressure → diamond → ~~bone~~ → ???

strikethrough = eliminated · AI judges every word in real-time

Cognitive Mapping

Every word you play is embedded into a 768-dimensional vector. We compare it against your topic anchors to map your mind.

Unique Identity

No two players think alike. Your semantic jumps generate a one-of-a-kind fingerprint that evolves every match.

AI Judge

Powered by Gemini embeddings. Cosine similarity decides relevance — not rules. Creative leaps are rewarded.

Every word you play is a data point. Over time, we build a high-dimensional map of how your mind connects ideas. This is how it works.

Step 01

Choose 5 Topic Anchors

When you sign up, you pick 5 topics that define your cognitive universe — things like Space, Music, History, or Biology. These become the axes of your personal Cognitive Radar.

Step 02

Play the Word Chain

In each match, players take turns submitting a word related to the previous one. No rules about what's related — that's the AI's job. The chain can go anywhere.

Step 03

AI Judges Every Word

Powered by Gemini's text-embedding-001 model. Each word is converted to a 768-dimensional vector. Cosine similarity determines if it's related enough. Below 0.65 — you're out.

Step 04

Your Radar Evolves

After each game, our BullMQ worker compares every word in the chain against your 5 anchor vectors. Words that land near an anchor add to your score for that topic. Play more, reveal more.
